

## HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use BUPROPION HYDROCHLORIDE EXTENDED-RELEASE TABLETS (XL) safely and effectively. See the full prescribing information for BUPROPION HYDROCHLORIDE EXTENDED-RELEASE TABLETS (XL).

BuPROPION Hydrochloride Extended-Release Tablets, USP for oral use Initial U.S. Approval: 1995

WARNING: SUICIDAL THOUGHTS AND BEHAVIORS	
<p><b>See full prescribing information for complete boxed warning.</b></p> <ul style="list-style-type: none"><li>Increased risk of suicidal thinking and behavior in children, adolescents, and young adults taking antidepressants. Monitor for worsening and emergence of suicidal thoughts and behaviors. (5.1)</li></ul>	

RECENT MAJOR CHANGES	
Boxed Warning	05/2017
Warnings and Precautions, Neuropsychiatric Adverse Events and Suicide Risk in Smoking Cessation Treatment (5.2)	05/2017

**INDICATIONS AND USAGE**

Bupropion hydrochloride extended-release tablets (XL) is an amineketone antidepressant, indicated for the treatment of major depressive disorder (MDD) and prevention of seasonal affective disorder (SAD). Periodically reevaluate long-term usefulness for the individual patient. (1)

### DOSE AND ADMINISTRATION

- General:**
  - Increase dose gradually to reduce seizure risk. (2.1, 5.3)
  - Periodically reassess the dose and need for maintenance treatment. (2.2)
- Major Depressive Disorder**
  - Starting dose: 150 mg once daily. Usual target dose: 300 mg once daily (2.2)
  - After 4 days, may increase the dose to 300 mg once daily. (2.2)

**Seasonal Affective Disorder**

- Initiate treatment in the autumn prior to onset of seasonal depressive symptoms. (2.3)
- Starting dose: 150 mg once daily. Usual target dose: 300 mg once daily. (2.3)
- After one week, may increase the dose to 300 mg once daily. (2.3)
- Continue treatment through the winter season. (2.3)

### Hepatic Impairment

- Moderate to severe hepatic impairment: 150 mg every other day (2.6)
- Mild hepatic impairment: Consider reducing the dose and/or frequency of dosing. (2.6, 8.7)

### Renal Impairment

- Consider reducing the dose and/or frequency of dosing. (2.7, 8.6)

### DOSEAGE FORMS AND STRENGTHS

- Extended-release tablets: 150 mg, 300 mg (3)

### CONTRAINDICATIONS

- Seizure disorder (4, 5.3)
- Current or prior diagnosis of bulimia or anorexia nervosa (4, 5.3)
- Acute discontinuation of alcohol, benzodiazepines, barbiturates, antiepileptic drugs (4, 5.3)
- Monamine Oxidase Inhibitors (MAOIs): Do not use MAOIs intended to treat psychiatric disorders with bupropion hydrochloride extended-release tablets (XL) or within 14 days of stopping treatment with bupropion hydrochloride extended-release tablets (XL). Do not use bupropion hydrochloride extended-release tablets (XL) within 14 days of stopping an MAOI intended to treat psychiatric disorders. In addition, do not start bupropion hydrochloride extended-release tablets (XL) in a patient who has received MAOI treatment within 14 days of the last dose. (4, 5.3)

### DOSEAGE FORMS AND STRENGTHS

- Extended-release tablets: 150 mg, 300 mg (3)

### CONTRAINDICATIONS

- Seizure disorder (4, 5.3)
- Current or prior diagnosis of bulimia or anorexia nervosa (4, 5.3)
- Acute discontinuation of alcohol, benzodiazepines, barbiturates, antiepileptic drugs (4, 5.3)
- Monamine Oxidase Inhibitors (MAOIs): Do not use MAOIs intended to treat psychiatric disorders with bupropion hydrochloride extended-release tablets (XL) or within 14 days of stopping treatment with bupropion hydrochloride extended-release tablets (XL). Do not use bupropion hydrochloride extended-release tablets (XL) within 14 days of stopping an MAOI intended to treat psychiatric disorders. In addition, do not start bupropion hydrochloride extended-release tablets (XL) in a patient who has received MAOI treatment within 14 days of the last dose. (4, 5.3)

### DOSEAGE FORMS AND STRENGTHS

- Extended-release tablets: 150 mg, 300 mg (3)

### CONTRAINDICATIONS

- WARNINGS AND PRECAUTIONS**
- 5.1 Suicidal Thoughts and Behaviors in Children, Adolescents, and Young Adults**
- 5.2 Neuropsychiatric Adverse Events and Suicide Risk in Smoking Cessation Treatment**
- 5.3 Seizure**
- 5.4 Hypertension**
- 5.5 Activation of Mania/Hypomania**
- 5.6 Psychosis and Other Neuropsychiatric Reactions**
- 5.7 Angle-Closure Glaucoma**
- 5.8 Hypersensitivity Reactions**
- ADVERSE REACTIONS**
- 6.1 Clinical Trials Experience**
- 6.2 Postmarketing Experience**

WARNING:SUICIDAL THOUGHTS AND BEHAVIORS	
<p><b>SUICIDALTY AND ANTIDEPRESSANT DRUGS</b></p> <p>Antidepressants increased the risk of suicidal thoughts and behavior in children, adolescents, and young adults in short-term trials. These trials did not show an increase in the risk of suicidal thoughts and behavior with antidepressant use in subjects aged 65 and older [see Warnings and Precautions (5.1)].</p> <p>In patients of all ages who are started on antidepressant therapy, monitor closely for worsening, and for emergence of suicidal thoughts and behaviors. Advise families and caregivers of the need for close observation and communication with the prescriber [see Warnings and Precautions (5.1)].</p>	
<p><b>INDICATIONS AND USAGE</b></p> <p><b>1.1 Major Depressive Disorder</b></p> <p>Bupropion hydrochloride extended-release tablets (XL) are indicated for the treatment of major depressive disorder (MDD), as defined by the Diagnostic and Statistical Manual (DSM).</p> <p>The efficacy of the immediate-release formulation of bupropion was established in a 4-week controlled tablet trial and one 5-week controlled subpanel trial of adult patients with MDD. The efficacy of the sustained-release formulation of bupropion in the maintenance treatment of MDD was established in a long-term (up to 44 weeks), placebo-controlled trial in patients who had responded to bupropion in an 8-week study of acute treatment [see Clinical Studies (14.1)].</p>	
<p><b>1.2 Seasonal Affective Disorder</b></p> <p>Bupropion hydrochloride extended-release tablets (XL) are indicated for the prevention of seasonal major depressive episodes in patients with a diagnosis of seasonal affective disorder (SAD).</p> <p>The efficacy of bupropion hydrochloride extended-release tablets in the prevention of seasonal major depressive episodes was established in 3 placebo-controlled trials in adult outpatients with a history of major depressive disorder with seasonal pattern as defined in the DSM [see Clinical Studies (14.2)].</p>	
<p><b>2 DOSE AND ADMINISTRATION</b></p> <p><b>2.1 General Instructions for Use</b></p> <p>To minimize the risk of seizure, increase the dose gradually [see Warnings and Precautions (5.3)].</p> <p>Bupropion hydrochloride extended-release tablets (XL) should be swallowed whole and not crushed, divided, or chewed. Bupropion hydrochloride extended-release tablets (XL) should be administered in the morning and may be taken with or without food.</p> <p><b>2.2 Dosage for Major Depressive Disorder (MDD)</b></p> <p>The recommended starting dose for MDD is 150 mg once daily in the morning. After 4 days of dosing, the dose may be increased to the target dose of 300 mg once daily in the morning.</p> <p>It is generally agreed that acute episodes of depression require several months or longer of antidepressant treatment beyond the response in the acute episode. It is unknown whether the bupropion hydrochloride extended-release tablets (XL) dose needed for maintenance treatment is identical to the dose that provided an initial response. Periodically reassess the need for maintenance treatment and the appropriate dose for such treatment.</p> <p><b>2.3 Dosage for Seasonal Affective Disorder (SAD)</b></p> <p>The recommended starting dose for SAD is 150 mg once daily. After 7 days of dosing, the dose may be increased to the target dose of 300 mg once daily in the morning. Doses above 300 mg of bupropion HCl extended-release were not assessed in the SAD trials.</p> <p>For the prevention of seasonal MDD episodes associated with SAD, initiate bupropion hydrochloride extended-release tablets (XL) in the autumn, prior to the onset of discontinuing treatment with bupropion hydrochloride tablets (XL) in early spring. For patients treated with 300 mg per day, decrease the dose to 150 mg once daily before discontinuing bupropion hydrochloride extended-release tablets (XL). Individualize the timing of discontinuation and duration of treatment should be individualized, based on the patient's historical pattern of seasonal MDD episodes.</p>	
<p><b>2.4 Switching Patients from WELLBUTRIN® Tablets (bupropion hydrochloride extended-release tablets) or from WELLBUTRIN SR® Sustained-Release Tablets (SR) (bupropion hydrochloride extended-release tablets) to BUPROPION HYDROCHLORIDE EXTENDED-RELEASE TABLETS (XL)</b></p> <p>Patients who are currently receiving treatment with bupropion hydrochloride extended-release tablets (XL) may require urgent treatment with inhaled or intravenous methylene blue. If acceptable alternatives to inhaled or intravenous methylene blue are not available and the potential benefits of inhaled or intravenous methylene blue treatment are judged to outweigh the risks of hypersensitivity reactions in a particular patient, bupropion hydrochloride extended-release tablets (XL) should be stopped promptly, and inhaled or intravenous methylene blue should be administered. The patient should be monitored for 2 weeks or until 24 hours after the last dose of inhaled or intravenous methylene blue, whichever comes first. Therapy with bupropion hydrochloride extended-release tablets (XL) may be resumed 24 hours after the last dose of inhaled or intravenous methylene blue.</p> <p>The risk of administering methylene blue to non-intoxicated outpatients (such as oral tablets or by local injection) if an intravenous methylene blue treatment is needed is much lower than 1 mg per kg with bupropion hydrochloride extended-release tablets (XL) [see Warnings and Precautions (5.3)]. However, the use of methylene blue in patients with a diagnosis of seasonal affective disorder (SAD) is unclear. The clinician should, nevertheless, be aware of the possibility of a drug interaction with such use [see CONTRAINDICATIONS (4) and Drug Interactions (7.6)].</p>	<p>300 mg once daily, decrease the dose to 150 mg once daily prior to discontinuation.</p> <p><b>2.6 Dosage Adjustment in Patients with Hepatic Impairment</b></p> <p>Moderate to severe hepatic impairment (Child-Pugh score: 7 to 15), the maximum dose is 150 mg every other day. In patients with mild hepatic impairment (Child-Pugh score: 5 to 6), consider reducing the dose and/or frequency of dosing [see Use in Specific Populations (8.7) and Clinical Pharmacology (12.3)].</p> <p><b>2.7 Dose Adjustment in Patients with Renal Impairment</b></p> <p>Consider reducing the dose and/or frequency of WELLBUTRIN® (bupropion hydrochloride tablets), the immediate-release formulation and patients with renal impairment (glomerular filtration rate less than 50 mL/min) [see Use in Specific Populations (8.8) and Clinical Pharmacology (12.3)].</p> <p><b>2.8 Switching a Patient to or from a Monoamine Oxidase Inhibitor (MAOI) Antidepressant</b></p> <p>At least 14 days should elapse between discontinuation of an MAOI intended to treat depression and initiation of therapy with bupropion hydrochloride extended-release tablets (XL). Conversely, at least 14 days should elapse between stopping bupropion hydrochloride extended-release tablets (XL) and starting an MAOI antidepressant [see CONTRAINDICATIONS (4) and Drug Interactions (7.6)].</p>
<p><b>2.9 Use of Bupropion Hydrochloride Extended-Release Tablets (XL) with Reversible MAOIs such as Linezolid or Methylene Blue</b></p> <p><b>3 DOSEAGE FORMS AND STRENGTHS</b></p> <p><b>4 CONTRAINDICATIONS</b></p> <p><b>5 WARNINGS AND PRECAUTIONS</b></p> <p><b>5.1 Suicidal Thoughts and Behaviors in Children, Adolescents, and Young Adults</b></p> <p><b>5.2 Neuropsychiatric Adverse Events and Suicide Risk in Smoking Cessation Treatment</b></p> <p><b>5.3 Seizure</b></p> <p><b>5.4 Hypertension</b></p> <p><b>5.5 Activation of Mania/Hypomania</b></p> <p><b>5.6 Psychosis and Other Neuropsychiatric Reactions</b></p> <p><b>5.7 Angle-Closure Glaucoma</b></p> <p><b>5.8 Hypersensitivity Reactions</b></p> <p><b>ADVERSE REACTIONS</b></p> <p><b>6.1 Clinical Trials Experience</b></p> <p><b>6.2 Postmarketing Experience</b></p>	

- patient who is being treated with inhaled or intravenous methylene blue (4, 7.6)
- Known hypersensitivity to bupropion or other ingredients of bupropion hydrochloride extended-release tablets (XL) (4, 5.8)

### WARNINGS AND PRECAUTIONS

- Neuropsychiatric Adverse Events During Smoking Cessation:** Postmarketing reports of serious or clinically significant neuropsychiatric adverse events have included changes in mood (including depression and mania), psychosis, hallucinations, paranoia, delusions, homicidal ideation, aggression, hostility, agitation, anxiety, and panic, as well as suicidal ideation, suicide attempt, and completed suicide. Observe patients attempting to quit smoking with bupropion hydrochloride extended-release tablets (XL) for the occurrence of such symptoms and instruct them to discontinue bupropion hydrochloride extended-release tablets (XL) and contact a healthcare provider if they experience such adverse events. (5.2)
- Seizure Risk:** The risk is dose-related. Can minimize risk by limiting daily dose to 450 mg and gradually increasing the dose. Discontinue if seizure occurs. (4, 5.3, 7.3)
- Hypertension:** Bupropion hydrochloride extended-release tablets (XL) can increase blood pressure. Monitor blood pressure before initiating treatment and periodically during treatment. (5.4)
- Activation of Mania/Hypomania:** Screen patients for bipolar disorder and monitor for these symptoms. (5.5)
- Psychosis and Other Neuropsychiatric Reactions:** Instruct patients to contact a healthcare professional if such reactions occur. (5.6)
- Angle-Closure Glaucoma:** Angle-closure glaucoma has occurred in patients with untreated anatomically narrow angles treated with antidepressants. (5.7)

### ADVERSE REACTIONS

Most common adverse reactions are (incidence ≥5%, ≥2x placebo rate): dry mouth, nausea, insomnia, dizziness, pharyngitis, abdominal pain, agitation, anxiety, tremor, palpitation, sweating, tinnitus, myalgia, anorexia, urinary frequency, rash. (6.1)

### TO REPORT SUSPECTED ADVERSE REACTIONS, CONTACT PAR Pharmaceutical at 1-800-828-9393 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

### DRUG INTERACTIONS

- CYP2B6 inducers: Dose increase may be necessary if coadministered with CYP2B6 inducers (e.g., ritonavir, lopinavir, efavirenz, carbamazepine, phenobarbital, and phenytoin) based on clinical exposure, but should not exceed the maximum recommended dose. (7.1)
- Drugs metabolized by CYP2D6:** Bupropion inhibits CYP2D6 and can increase concentrations of antidepressants (e.g., venlafaxine, nortriptyline, imipramine, desipramine, paroxetine, fluoxetine, sertraline), antipsychotics (e.g., haloperidol, risperidone, thioridazine), beta-blockers (e.g., metoprolol), and Type 1C antiarrhythmics (e.g., propafenone, flecainide). Consider dose reduction when using with bupropion. (7.2)
- Drugs that lower seizure threshold:** Dose bupropion hydrochloride extended-release tablets (XL) with caution. (5.3, 7.3)
- Dopaminergic Drugs (levodopa and amantadine):** CNS toxicity can occur when used concomitantly with bupropion hydrochloride extended-release tablets (XL) (7.4)
- MAOIs:** Increased risk of hypertensive reactions can occur when used concomitantly with bupropion hydrochloride extended-release tablets (XL). (7.6)
- Drug-laboratory test interactions:** Bupropion hydrochloride extended-release tablets (XL) can cause false-positive urine test results for amphetamines. (7.7)

### USE IN SPECIFIC POPULATIONS

- Pregnancy.** Use only if benefit outweighs potential risk to the fetus. (8.1)

### FOR PATIENT COUNSELING INFORMATION and Medication Guide.

whether or not they are taking antidepressant medications, and this risk may persist until significant remission occurs. Suicide is a known risk of depression and certain psychiatric disorders, and these disorders themselves are the strongest predictors of suicide. There has been a long-standing concern that antidepressants may have a role in increasing the severity of depression and the emergence of suicidality in certain patients during the early phases of treatment.

Pooled analyses of short-term placebo-controlled trials of antidepressant drugs (Selective Serotonin Reuptake Inhibitors [SSRIs] and other) shows that these drugs increase the risk of suicidal thinking and behavior (suicidality) in children, adolescents, and young adults with major depressive disorder (MDD) and other psychiatric disorders. Short-term studies did not show an increase in the risk of suicidality with antidepressants compared to placebo in adults beyond age 24; there was a reduction with antidepressant compared to placebo in adults aged 65 and older.

The pooled analyses of placebo-controlled trials in children and adolescents with MDD, obsessive compulsive disorder (OCD), or other psychiatric disorders included a total of 24 short-term trials of antidepressant drug treatment in pediatric patients. The pooled analyses included 19 trials in children and adolescents, which included a total of 295 short-term trials (median duration of 2 months) of 11 antidepressant drugs over 77,000 patients. There was considerable variation in risk of suicidality among drugs, but a tendency toward an increase in the risk of suicidality with all antidepressant drugs compared to placebo, across the various psychiatric disorders and in the younger patients. These analyses also tended to show that suicidal thoughts and actions increased over time, particularly across the different indications, with the highest increase in MDD. The risks differences (drug vs. placebo) however, were relatively stable with age strata and across indications. These risk differences (drug-placebo difference) in the number of cases of suicidality per 1,000 patients treated are reported in Table 1.

Age Range	Drug-Placebo Difference in Number of Cases of Suicidality per 1,000 Patients Treated
<18 years	14 additional cases
18 to 24 years	5 additional cases

Age Range	Drug-Placebo Difference in Number of Cases of Suicidality per 1,000 Patients Treated
25 to 64 years	fewer cases
≥65 years	6 fewer cases

No suicides occurred in any of the pediatric trials. There were suicides in the adult trials, but the number was not sufficient to reach any conclusion about drug effect on suicide.

It is unknown whether the suicidality risk extends to longer-term use, i.e., beyond several months. However, there is substantial evidence from placebo-controlled maintenance trials in adults with depression that the use of antidepressants can delay the recurrence of depression.

All patients being treated with antidepressants for any indication should be monitored appropriately and observed closely for clinical worsening, suicidality, and unusual changes in behavior, especially during the initial few months of course of drug therapy, or at times of dose changes, either increases or decreases [see **Boxed Warning and Use in Specific Populations (8.4)**].

The following symptoms, anxiety, agitation, panic attacks, insomnia, irritability, hostility, aggressiveness, impulsivity, akathisia (psychomotor restlessness), hypomania, and mania, have been reported in adult and pediatric patients being treated with antidepressants for major depressive disorder as well as for other indications, both psychiatric and nonpsychiatric. Although a causal link between the emergence of such symptoms and either the worsening of depression and/or the emergence of suicidal impulses has not been established, there is concern that such symptoms may represent precursors to emerging suicidality.

Consideration should be given to changing the therapeutic regimen, including possibly discontinuing the medication, in patients whose depression is persistently worse, or who are experiencing emergent suicidality or symptoms that might be precursors to worsening depression or suicidality, especially if these symptoms are severe, abrupt in onset, or were not part of the patient's presenting symptoms.

Families and caregivers of patients being treated with antidepressants for major depressive disorder or other indications, both psychiatric and nonpsychiatric, should be alerted about the need to monitor patients for the emergence of agitation, irritability, unusual changes in behavior, and the other symptoms described above, as well as the emergence of suicidality, and to report such symptoms immediately to healthcare providers. Such monitoring should include daily observation by families and caregivers. Prescriptions for bupropion hydrochloride extended-release tablets (XL) should be written or transmitted to patients consistent with good patient management, in order to reduce the risk of overdose.

**5.2 Neuropsychiatric Adverse Events and Suicide Risk in Smoking Cessation Treatment**

Bupropion hydrochloride extended-release tablets (XL) are not approved for smoking cessation treatment; however, bupropion HCl sustained-release is approved for this use. Serious neuropsychiatric adverse events have been reported in patients taking bupropion for smoking cessation. These postmarketing reports have included changes in mood (including depression and mania), psychosis, hallucinations, delusions, homicidal ideation, aggression, hostility, agitation, anxiety, and panic, as well as suicidal ideation, suicide attempt, and completed suicide [see **Adverse Reactions (6.2)**]. Some patients who stopped smoking may have had experienced symptoms of nicotine withdrawal, including depressed mood. Depression, rarely including suicide ideation, has been reported in smokers undergoing a smoking cessation attempt without medication. However, some of these adverse events occurred in patients taking bupropion who continued to smoke.

Neuropsychiatric adverse events occurred in patients without and with pre-existing psychiatric disease, some patients experienced worsening of their psychiatric illnesses. Observers of patients with serious psychiatric adverse events. Advise patients and caregivers that the patient should stop taking bupropion hydrochloride extended-release tablets (XL) if they experience such symptoms, and to contact their healthcare provider immediately to discuss the symptoms and to report such symptoms immediately to healthcare providers. Such monitoring should include daily observation by families and caregivers. Prescriptions for bupropion hydrochloride extended-release tablets (XL) should be written or transmitted to patients consistent with good patient management, in order to reduce the risk of overdose.

**5.3 Seizure**

Bupropion hydrochloride extended-release tablets (XL) can cause seizure. The risk of seizure is dose-related. The dose should not exceed 300 mg once daily. Increase the dose gradually. Discontinue bupropion hydrochloride extended-release tablets (XL) and do not restart treatment if seizure occurs.

The risk of seizures is also related to patient factors, clinical situations, and concomitant medications that lower the seizure threshold. Consider these risks before initiating treatment with bupropion hydrochloride extended-release tablets (XL). Bupropion hydrochloride extended-release tablets (XL) are contraindicated in patients with a seizure disorder or conditions that increase the risk of seizure (e.g., severe head injury, arteriovenous malformation, CNS tumor or CNS infection, severe stroke, anorexia nervosa or bulimia, or abrupt discontinuation of alcohol, benzodiazepines, barbiturates, and antiepileptic drugs [see **CONTRAINDICATIONS (4)**]). The following conditions may also increase the risk of seizure: concomitant use of other medications that lower the seizure threshold (e.g., other bupropion products, antipsychotics, tricyclic antidepressants, theophylline, and systemic corticosteroids), metabolic disorders (e.g., hypokalemia, hyponatremia, severe hepatic impairment and hypocalcemia), or use of blood drugs (e.g., cocaine) or abuse or misuse of prescription drugs such as CNS stimulants. Additional predisposing conditions include diabetes mellitus treated with oral hypoglycemic drugs or insulin therapy, or concurrent use of alcohol, benzodiazepines, sedative-hypnotics, or opiates.

**5.4 Hypertension**

Treatment with bupropion hydrochloride extended-release tablets (XL) can result in elevated blood pressures and hypertension. Assess blood pressure before initiating treatment with bupropion hydrochloride extended-release tablets (XL), and monitor periodically during treatment. The risk of hypertension is increased if bupropion hydrochloride extended-release tablets (XL) are used concomitantly with MAOIs or other drugs that increase dopaminergic or noradrenergic activity [see **CONTRAINDICATIONS (4)**].

Data from a comparative trial of the sustained-release formulation of bupropion HCl, nicotine transdermal system (NTS), the combination of sustained-release bupropion plus NTS, and placebo as an aid to smoking cessation suggest a higher risk of hypertension with the combination of sustained-release bupropion plus NTS compared to sustained-release bupropion and NTS. In this trial, 61% of subjects treated with the combination of sustained-release bupropion and NTS had treatment-emergent hypertension compared to 2%, 1.6%, and 1.6% for sustained-release bupropion plus NTS, sustained-release bupropion, and NTS, respectively. The majority of these subjects had evidence of pre-existing hypertension. Three subjects (1.2%) treated with the combination of sustained-release bupropion and NTS and 1 subject (0.3%) treated with NTS had study medication discontinued due to hypertension compared with none of the subjects treated with sustained-release bupropion and placebo. Monitoring of blood pressure is recommended in patients who receive the combination of bupropion and NTS.

**5.5 Activation of Mania/Hypomania**

Hypertension was reported as an adverse reaction for 2% of the bupropion group (116337) and none in the placebo group (0511). In the SAD trials, 2 patients treated with bupropion discontinued from the study because they developed hypomania. None of the placebo group discontinued because of hypertension. The mean increase in systolic blood pressure was 1.3 mmHg in the bupropion group and 0.1 mmHg in the placebo group. The difference was statistically significant (p=0.013). The mean increase in diastolic blood pressure was 0.1 mmHg in the bupropion group and 0.1 mmHg in the placebo group. This difference was not statistically significant (p=0.075). In the SAD trials, 82% of patients were treated with 300 mg per day, and 18% were treated with 150 mg per day. The mean daily dose was 270 mg per day. The mean duration of bupropion treatment was 126 days.

In a clinical trial of bupropion immediate-release in MDD subjects with stable congestive heart failure (N=36), bupropion was associated with an exacerbation of pre-existing hypertension in 2 subjects, leading to discontinuation of bupropion treatment. There are no controlled studies assessing the safety of bupropion in patients with a recent history of myocardial infarction or unstable cardiac disease.

### 5.6 Psychosis and Other Neuropsychiatric Reactions

Depressed patients treated with bupropion have had a variety of neuropsychiatric signs and symptoms, including delusions, hallucinations, psychosis, concentration disturbance, paranoia, and confusion. Some of these symptoms have included homicidal ideation, aggression, hostility, delirium, and changes in behavior. Such symptoms have also been reported in patients with bipolar disorder and the presence of risk factors for bipolar disorder (e.g., family history of bipolar disorder, suicide, or depression). Bupropion hydrochloride extended-release tablets (XL) are not approved for the treatment of bipolar depression.

### 5.7 Angle-Closure Glaucoma

Angle-closure glaucoma (ACG) is a potentially sight-threatening condition. The pupillary dilation that occurs following use of many antidepressant drugs including bupropion hydrochloride extended-release tablets (XL) may trigger an angle-closure attack in a patient with anatomically narrow angles who does not have a prior iridectomy.

**5.8 Hypersensitivity Reactions**

Allergic/hypersensitivity reactions have occurred during clinical trials with bupropion. Reactions have been characterized by pruritus, urticaria, angioedema, and dyspnea, requiring medical treatment. In addition, there have been spontaneous postmarketing reports of erythema multiforme, Stevens-Johnson Syndrome, and allergic shock associated with bupropion. Instruct patients to discontinue bupropion hydrochloride extended-release tablets (XL) and contact a healthcare provider if they develop an allergic or anaphylactoid/hypersensitivity reaction (e.g., skin rash, edema, and chest pain, edema, and changes in breathing) during treatment. There are reports of atrial fibrillation, afebrile fever with rash and other symptoms of serum sickness suggestive of delayed hypersensitivity.

**ADVERSE REACTIONS**

The following adverse reactions are discussed in greater detail in other sections of the labeling:

- Suicidal thoughts and behaviors in children, adolescents, and young adults [see **Warnings and Precautions (5.1)**]
- Neuropsychiatric adverse events and suicide risk in smoking cessation treatment [see **Warnings and Precautions (5.2)**]
- Seizure [see **Warnings and Precautions (5.3)**]
- Hypertension [see **Warnings and Precautions (5.4)**]
- Activation of mania or hypomania [see **Warnings and Precautions (5.5)</**

Bupropion hydrochloride extended-release tablets (XL) should be used with a patient support program. It is important to participate in the behavioral program, counseling, or other support program your healthcare professional recommends.

Quitting smoking can lower your chances of having lung disease, heart disease, or getting certain types of cancer that are related to smoking.

**Who should not take bupropion hydrochloride extended-release tablets (XL)?**

**Do not take bupropion hydrochloride extended-release tablets (XL) if you:**

- have or had a seizure disorder or epilepsy.
- have or had an eating disorder such as anorexia nervosa or bulimia.
- are taking any other medicines that contain bupropion, including WELLBUTRIN<sup>®</sup>, WELLBUTRIN SR<sup>®</sup> (bupropion hydrochloride extended-release tablets (SR), APLENZIN<sup>®</sup>, ZYBAN<sup>®</sup>, or FORFIVO XL<sup>®</sup>. Bupropion is the same active ingredient that is in bupropion hydrochloride extended-release tablets (XL).
- drink a lot of alcohol and abruptly stop drinking, or take medicines called sedatives (these make you sleepy), or benzodiazepines, or anti-seizure medicines, and you stop taking them all of a sudden.
- take a monamine oxidase inhibitor (MAOI). Ask your healthcare provider or pharmacist if you are not sure if you take an MAOI, including the antibiotic linezolid.
- do not take an MAOI within 2 weeks of stopping bupropion hydrochloride extended-release tablets (XL) unless directed to do so by your healthcare provider.
- do not start bupropion hydrochloride extended-release tablets (XL) if you stopped taking an MAOI in the last 2 weeks unless directed to do so by your healthcare provider.

are allergic to the active ingredient in bupropion hydrochloride extended-release tablets (XL), bupropion, or to any of the inactive ingredients. See the end of this Medication Guide for a complete list of ingredients in bupropion hydrochloride extended-release tablets (XL).

**What should I tell my healthcare provider before taking bupropion hydrochloride extended-release tablets (XL)?**

Tell your healthcare provider if you have ever had depression, suicidal thoughts or actions, or other mental health problems. You should also tell your healthcare provider about any symptoms you had during other times you tried to quit smoking with or without bupropion hydrochloride extended-release tablets (XL). See "Quitting Smoking, Quit-Smoking Medications, Changes in Thinking and Behavior, Depression, and Suicidal Thoughts or Actions."

**Tell your healthcare provider about your other medical conditions, including if you:**

- have liver problems, especially cirrhosis of the liver.
- have kidney problems.
- have, or have had, an eating disorder such as anorexia nervosa or bulimia.
- have had a head injury.
- have had a seizure (convulsion, fit).
- have a tumor in your nervous system (brain or spine).
- have had a heart attack, heart problems, or high blood pressure.
- are a diabetic taking insulin or other medicines to control your blood sugar.
- drink alcohol.
- abuse prescription medicines or street drugs.
- are pregnant or plan to become pregnant.
- are breastfeeding. Bupropion hydrochloride extended-release tablets (XL) passes into your milk in small amounts.

**Tell your healthcare provider about all the medicines you take**, including prescription, over-the-counter medicines, vitamins, and herbal supplements. Many medicines increase your chances of having seizures or other serious side effects if you take them while you are taking bupropion hydrochloride extended-release tablets (XL).

**How should I take bupropion hydrochloride extended-release tablets (XL)?**

- Start bupropion hydrochloride extended-release tablets (XL) before you stop smoking to give bupropion hydrochloride extended-release tablets (XL) time to build up in your body. It takes about 1 week for bupropion hydrochloride extended-release tablets (XL) to start working.
- Pick a date to stop smoking that is during the second week you are taking bupropion hydrochloride extended-release tablets (XL).
- Take bupropion hydrochloride extended-release tablets (XL) exactly as prescribed by your healthcare provider. Do not change your dose or stop taking bupropion hydrochloride extended-release tablets (XL) without talking with your healthcare provider first.
- Bupropion hydrochloride extended-release tablets (XL) are usually taken for 7 to 12 weeks. Your healthcare provider may decide to prescribe bupropion hydrochloride extended-release tablets (XL) for longer than 12 weeks to help you stop smoking. Follow your healthcare provider's instructions.
- Swallow bupropion hydrochloride extended-release tablets (XL) whole. Do not chew, cut, or crush bupropion hydrochloride extended-release tablets (XL). If you do, the medicine will be released into your body too quickly. If this happens you may be more likely to get side effects including seizures.

**Tell your healthcare provider if you cannot swallow tablets.**

- Bupropion hydrochloride extended-release tablets (XL) may have an odor. This is normal.
- Take your doses of bupropion hydrochloride extended-release tablets (XL) at least 8 hours apart.
- You may take bupropion hydrochloride extended-release tablets (XL) with or without food.
- It is not dangerous to smoke and take bupropion hydrochloride extended-release tablets (XL) at the same time. But, you will lower your chance of breaking your smoking habit if you smoke after the date you set to stop smoking.
- You may use bupropion hydrochloride extended-release tablets (XL) and nicotine patches (a type of nicotine replacement therapy) at the same time, following the precautions below.
  - You should only use bupropion hydrochloride extended-release tablets (XL) and nicotine patches together under the care of your healthcare provider. Using bupropion hydrochloride extended-release tablets (XL) and nicotine patches together may raise your blood pressure, and sometimes this can be severe.
  - Tell your healthcare provider if you plan to use nicotine patches. Your healthcare provider should check your blood pressure regularly if you use nicotine patches with bupropion hydrochloride extended-release tablets (XL) to help you quit smoking.
- If you miss a dose, do not take an extra dose to make up for the dose you missed. Wait and take your next dose at the regular time. **This is very important.** Too much bupropion hydrochloride extended-release tablets (XL) can increase your chance of having a seizure.
- If you take too much bupropion hydrochloride extended-release tablets (XL), or overdose, call your local emergency room or poison control center right away.

**Do not take any other medicines while using bupropion hydrochloride extended-release tablets (XL) unless your healthcare provider has told you it is okay.**

**What should I avoid while taking bupropion hydrochloride extended-release tablets (XL)?**

- Limit or avoid using alcohol during treatment with bupropion hydrochloride extended-release tablets (XL). If you usually drink a lot of alcohol, talk with your healthcare provider before suddenly stopping. If you suddenly stop drinking alcohol, you may increase your chance of having seizures.
- Do not drive a car or use heavy machinery until you know how bupropion hydrochloride extended-release tablets (XL) affects you. Bupropion hydrochloride extended-release tablets (XL) can affect your ability to do these things safely.

**What are the possible side effects of bupropion hydrochloride extended-release tablets (XL)?**

Bupropion hydrochloride extended-release tablets (XL) can cause serious side effects. See the sections at the beginning of this Medication Guide for information about serious side effects of bupropion hydrochloride extended-release tablets (XL).

The most common side effects of bupropion hydrochloride extended-release tablets (XL) include:

- trouble sleeping
- stuffy nose
- dry mouth
- dizziness
- feeling anxious
- nausea
- constipation
- joint aches

If you have trouble sleeping, do not take bupropion hydrochloride extended-release tablets (XL) too close to bedtime.

Tell your healthcare provider right away about any side effects that bother you.

These are not all the possible side effects of bupropion hydrochloride extended-release tablets (XL). For more information, ask your healthcare provider or pharmacist.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

You may also report side effects to Par Pharmaceutical at 1-800-828-9393.

**How should I store bupropion hydrochloride extended-release tablets (XL)?**

Store bupropion hydrochloride extended-release tablets (XL) at 68°F to 77°F (20° C to 25° C) [see USP Controlled Room Temperature].

Preserve in well-closed containers. Protect from light.

**Keep bupropion hydrochloride extended-release tablets (XL) and all medicines out of the reach of children.**

**General information about the safe and effective use of bupropion hydrochloride extended-release tablets (XL).**

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use bupropion hydrochloride extended-release tablets (XL) for a condition for which it was not prescribed. Do not give bupropion hydrochloride extended-release tablets (XL) to other people, even if they have the same symptoms you have. It may harm them.

If you take a urine drug screening test, bupropion hydrochloride extended-release tablets (XL), may make the test result positive for amphetamines. If you tell the person giving you the drug screening test that you are taking bupropion hydrochloride extended-release tablets (XL), they can do a more specific drug screening test that should not have this problem.

This Medication Guide summarizes important information about bupropion hydrochloride extended-release tablets (XL). If you would like more information, talk with your healthcare provider. You can ask your healthcare provider or pharmacist for information about bupropion hydrochloride extended-release tablets (XL) that is written for health professionals.

**What are the ingredients in bupropion hydrochloride extended-release tablets (XL)?**

Active ingredient: bupropion hydrochloride.

Inactive ingredients: dehydrated alcohol, ethylcellulose, hydrochloric acid, hydroxypropylcellulose, methacrylic acid copolymer, povidone, silicon dioxide, hydrogenated vegetable oil and ethyl alcohol. The tablets are printed with edible black ink.

WELLBUTRIN XL<sup>®</sup> is a registered trademark of GlaxoSmithKline. All other product/brand names are the trademarks of their respective owners.

**This Medication Guide has been approved by the U.S. Food and Drug Administration.**

**Par Pharmaceutical**  
Chestnut Ridge, NY 10977

RO517

**8.4 Pediatric Use**

Safety and effectiveness in the pediatric population have not been established. When considering the use of bupropion hydrochloride extended-release tablets (XL) in a child or adolescent, balance the potential risks with the clinical need [see **Boxed Warning and Warnings and Precautions** (5.1)].

**8.5 Geriatric Use**

Of the approximately 6,000 patients who participated in clinical trials with bupropion hydrochloride sustained-release tablets (depression and smoking cessation studies), 275 were ≥65 years old and 47 were ≥75 years old. In addition, several hundred patients ≥65 years of age participated in clinical trials using the immediate-release formulation of bupropion hydrochloride (depression studies). No overall differences in safety or effectiveness were observed between these subjects and younger subjects. Reported clinical experience has not identified differences in responses between the elderly and younger patients, but greater sensitivity of some older individuals cannot be ruled out.

Bupropion is extensively metabolized in the liver to active metabolites, which are further metabolized and excreted by the kidneys. The risk of adverse reactions may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, it may be necessary to consider this factor in dose selection; it may be useful to monitor renal function [see **Dosage and Administration** (2.7), **Use in Specific Populations** (8.6), and **Clinical Pharmacology** (12.3)].

**8.6 Renal Impairment**

Consider a reduced dose and/or dosing frequency of bupropion hydrochloride extended-release tablets (XL) in patients with renal impairment (glomerular filtration rate <30 mL/min). Bupropion and its metabolites are cleared renally and may accumulate in such patients to a greater extent than usual. Monitor closely during adverse reactions that could indicate bupropion or metabolite exposures [see **Dosage and Administration** (2.7) and **Clinical Pharmacology** (12.3)].

**8.7 Hepatic Impairment**

In patients with moderate to severe hepatic impairment (Child-Pugh score: 7 to 15), the maximum bupropion hydrochloride extended-release tablets (XL) dose is 150 mg every other day. In patients with mild hepatic impairment (Child-Pugh score: 5 to 6), consider reducing the dose and/or frequency of dosing [see **Dosage and Administration** (2.7) and **Clinical Pharmacology** (12.3)].

**9 DRUG ABUSE AND DEPENDENCE**

**9.1 Controlled Substance**

Bupropion is not a controlled substance.

**9.2 Abuse**

Controlled clinical studies of bupropion HCl immediate-release conducted in normal volunteers, in subjects with a history of multiple drug abuse, and in depressed patients demonstrated an increase in motor activity and agitation/irritability.

In a population of individuals experienced with drugs of abuse, a single dose of 400 mg bupropion produced mild amphetamine-like activity comparable to placebo on the Morphine-Benazone Subjective Questionnaire of Addiction Research Center inventories (ARC), and a score intermediate between placebo and amphetamine on the Lings Scale of the ARC. These scales measure general feelings of euphoria and drug desirability.

Findings in clinical trials, however, are not known to reliably predict the abuse potential of drugs. Nonetheless, evidence from single-dose studies does suggest that the recommended daily dosage of bupropion when administered in divided doses is not likely to be significantly reinforcing to amphetamine or CNS stimulant abusers. However, higher doses (that could not be tested because of the risk of seizure) might be modestly attractive to those who abuse CNS stimulant drugs.

Bupropion hydrochloride extended-release tablets are intended for oral use only. The inhalation of crushed tablets or injection of dissolved bupropion has not been reported. Seizures and/or cases of death have been reported when bupropion has been administered intranasally or by pararectal injection.

**Animals**

Studies in rodents and primates demonstrated that bupropion exhibits some pharmacologic actions common to psychostimulants. In rodents, it has been shown to increase locomotor activity, elicit a mild stereotyped behavioral response, and increase rates of responding in several schedule-controlled behavior paradigms. In primate models assessing the positive reinforcing effects of psychactive drugs, bupropion was self-administered intravenously. In these studies, bupropion produced amphetamine-like and cocaine-like discriminative stimulus effects in drug discrimination paradigms used to characterize the subjective effects of psychactive drugs.

**10 OVERDOSAGE**

**10.1 Human Overdose Experience**

Overdoses of up to 30 grams or more of bupropion have been reported. Seizure was reported in approximately one third of all cases. Other serious reactions reported with overdoses of bupropion alone included hallucinations, loss of consciousness, sinus tachycardia, and ECG changes such as conduction disturbances or arrhythmias. Fever, muscle rigidity, myoglobinuria, hypotension, stupor, coma, and respiratory failure have been reported mainly when bupropion was part of multiple drug overdoses.

Although most patients recovered without sequelae, deaths associated with overdoses of bupropion alone have been reported in patients ingesting large doses of the drug. Multiple uncontrolled seizures, bradycardia, cardiac failure, and cardiac arrest prior to death were reported in these patients.

**10.2 Overdosage Management**
Consult a Certified Poison Control Center for up-to-date guidance and advice. Telephone numbers for certified poison control centers are listed in the Physicians Desk Reference (PDR), Call 1-800-222-1222 or refer to www.pdnonline.org.

There are no known antidotes for bupropion. In case of an overdose, provide supportive care, including close medical supervision and monitoring. Consider the possibility of multiple drug overdose.

**11 DESCRIPTION**

Bupropion Hydrochloride Extended-Release Tablets USP (XL) are an antiepileptic of the aminoketone class, is chemically unrelated to tricyclic, tetracyclic, selective serotonin reuptake inhibitor, or other known antidepressant agents. Its structure closely resembles that of dextropropriolol; it is related to phenylethylamines. It is designated as (±)-(1-(3-chlorophenyl)-2-(1-(dimethylamino)-1-propanone hydrochloride). The molecular weight of the molecular formula is C<sub>16</sub>H<sub>18</sub>ClNO. Bupropion hydrochloride powder is white, crystalline, and highly soluble in water. It has a bitter taste and produces the sensation of focal anesthesia on the oral mucosa. The structural formula is:

Bupropion hydrochloride extended-release tablets (XL) are supplied for oral administration as 150 mg and 300 mg white to off-white extended-release tablets. Each tablet contains the labeled amount of bupropion hydrochloride and the inactive ingredients: dehydrated alcohol, ethylcellulose, hydrochloric acid, hydroxypropylcellulose, methacrylic acid copolymer, povidone, silicon dioxide, hydrogenated vegetable oil and ethyl alcohol. The tablets are printed with edible black ink.

The insoluble shell of the extended-release tablet may remain intact during gastrointestinal transit and is eliminated in the feces.

Meets USP Dissolution Test 8.

**12 CLINICAL PHARMACOLOGY**

**12.1 Mechanism of Action**

The mechanism of action of bupropion is unknown, as is the case with other antidepressants. However, it is presumed that this action is mediated by noradrenergic and/or dopaminergic mechanisms. Bupropion is a relatively weak inhibitor of the neuronal uptake of norepinephrine and dopamine and does not inhibit monoamine oxidase in the respiratory or serotonergic system.

**12.3 Pharmacokinetics**

Bupropion is a racemic mixture. The pharmacologic activity and pharmacokinetics of the individual enantiomers have not been studied.

Following chronic dosing, the mean steady-state plasma concentration of bupropion was reached within 8 days. The mean elimination half-life (±SD) of bupropion is 31 (±4) hours.

In a study comparing 14-day dosing with bupropion hydrochloride extended-release tablets (XL), 300 mg once-daily to the immediate-release formulation of bupropion at 100 mg 3 times daily, equivalence was demonstrated for peak plasma concentration and area under the curve for bupropion and the three metabolites (hydroxybupropion, threohydroxybupropion, and erythrohydroxybupropion).

Additionally, in a study comparing 14-day dosing with bupropion hydrochloride extended-release tablets (XL), 300 mg once-daily to the sustained-release formulation of bupropion at 150 mg 2 times daily, equivalence was demonstrated for peak plasma concentration and area under the curve for bupropion and the three metabolites.

**Adaptation**
Following single oral administration of bupropion hydrochloride extended-release tablets (XL) to healthy volunteers, the median time to peak plasma concentrations for bupropion was approximately 5 hours. The presence of food did not affect the peak concentration or area under the curve of bupropion.

**Distribution**

In vitro tests show that bupropion is 84% bound to human plasma proteins at concentrations up to 200 mg/mL. The extent of protein binding of the hydroxybupropion metabolite is similar to that for bupropion, whereas the extent of protein binding of the threohydroxybupropion metabolite is about half that of bupropion.

**Metabolism**

Bupropion is extensively metabolized in humans. Three metabolites are active: hydroxybupropion, which is formed via hydroxylation of bupropion, and the amino alcohol isomers threohydroxybupropion and erythrohydroxybupropion, which are also formed via reduction of the carbonyl group. In vitro findings suggest that CYP2B6 is the principal isoenzyme involved in the formation of hydroxybupropion, while cytochromes P450 enzymes are not involved in the formation of threohydroxybupropion and erythrohydroxybupropion. In-chain results in the formation of a glycine conjugate of meta-chlorobenzonic acid, which is then excreted as the major urinary metabolite. The potency and toxicity of the metabolites related to bupropion have not been fully characterized. However, in a separate, non-clinical screening test, meta-chlorobenzonic acid was found to be more potent than bupropion. This may be of clinical importance, because the plasma concentrations of the metabolites are one-half or higher than those of bupropion.

At steady-state, peak plasma concentration of hydroxybupropion occurred approximately 7 hours after administration of bupropion hydrochloride extended-release tablets (XL), and it was approximately 7 times the peak level of the parent drug. The elimination half-life of hydroxybupropion is approximately 20 (±5) hours, and its AUC at steady-state is about 13 times that of bupropion. The times to peak concentrations for the erythrohydroxybupropion and threohydroxybupropion metabolites are similar to that of bupropion. However, the elimination half-lives of erythrohydroxybupropion and threohydroxybupropion are longer, approximately 33 (±10) and 37 (±13) hours, respectively, and steady-state AUCs were 1.4 and 7 times that of bupropion, respectively. Bupropion and its metabolites exhibit linear kinetics following chronic administration of 300 to 450 mg/day.

**Elimination**

Following oral administration of 200 mg of <sup>14</sup>C-bupropion in humans, 87% and 10% of the radioactive dose were recovered in the urine and feces, respectively. Only 0.5% of the oral dose was excreted as unchanged bupropion.

**Population Subgroups**

Factors or conditions altering metabolic capacity (i.e., liver disease, congestive heart failure [CHF], age, concomitant medications, etc.) or elimination may be expected to influence the degree and extent of accumulation of the active metabolites of bupropion. The elimination of the major metabolites of bupropion was not affected by reduced renal or hepatic function, because they are moderately polar compounds and are likely to undergo further metabolism or conjugation in the liver prior to urinary excretion.

**Renal Impairment**

There is limited information on the pharmacokinetics of bupropion in patients with renal impairment. An inter-trial comparison between normal subjects and subjects with end-stage renal failure demonstrated that the parent drug C<sub>16</sub> and AUC values were comparable in the 2 groups, whereas the hydroxybupropion and threohydroxybupropion metabolites had a 2.3- and 2.8-fold increase, respectively, in AUC for subjects with end-stage renal failure. A second study, comparing normal subjects and subjects with moderate-to-severe renal impairment (GFR 30.9 ± 10.8 mL/min) showed that after a single 150 mg dose of sustained-release bupropion, exposure to bupropion was approximately 2-fold higher in subjects with impaired renal function, while levels of the hydroxybupropion and threohydroxybupropion (combined) metabolites were similar in the 2 groups. Bupropion is extensively metabolized in the liver to active metabolites, which are further metabolized and subsequently excreted by the kidneys. The elimination of the major metabolites of bupropion may be reduced or impaired renal function. Bupropion hydrochloride extended-release tablets (XL) should be given with caution in patients with renal impairment, and a reduced frequency and/or dose should be considered [see **Dosage and Administration** (2.7) and **Use in Specific Populations** (8.6)].

**Hepatic Impairment**

The effect of hepatic impairment on the pharmacokinetics of bupropion was characterized in 2 single-dose trials, one in subjects with alcoholic liver disease and one in subjects with mild to severe cirrhosis. The trial demonstrated that the half-life of hydroxybupropion was significantly longer in 8 subjects with alcoholic liver disease than in 8 healthy volunteers (32±14 hours versus 21±5 hours, respectively). Although not statistically significant, the AUCs for bupropion and hydroxybupropion were more variable and tended to be greater (by 53% to 57%) in patients with alcoholic liver disease. The differences in half-life for bupropion and the other metabolites in the 2 groups were minimal.

The second trial demonstrated no statistically significant differences in the pharmacokinetics of bupropion and

extended-release tablets (XL). Instruct patients, their families, and their caregivers to read the Medication Guide and assist them in understanding its contents. Patients should be given the opportunity to discuss the contents of the Medication Guide and to obtain answers to any questions they may have. The complete text of the Medication Guide is reprinted at the end of this document.

Advise patients regarding the following issues and to alert their prescriber if these occur while taking bupropion hydrochloride extended-release tablets (XL).

**Suicidal Thoughts and Behaviors**

Instruct patients that their families and/or their caregivers to be alert to the emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, aggressiveness, impulsivity, akathisia (psychomotor restlessness), hypomania, mania, other unusual changes in behavior, worsening of depression, and suicidal ideation, especially early during antidepressant treatment and when the dose is adjusted up or down. Advise families and caregivers to be alert to observe any changes in such symptoms on a day-to-day basis, since changes may be abrupt. Such symptoms should be reported to the patient's prescriber or health professional, especially if they are severe, abrupt in onset, or were not part of the patient's presenting symptoms. Symptoms such as these may be associated with an increased risk for suicidal thinking and behavior and indicate a need for very close monitoring and possibly changes in the medication.

**Neurospicytic Adverse Events and Suicide Risk in Smoking Cessation Treatment**
Although bupropion hydrochloride extended-release tablets (XL) are not indicated for smoking cessation treatment, it contains the same active ingredient as ZYBAN<sup>®</sup> which is approved for this use. Inform patients that some patients have experienced changes in mood (including depression and mania), psychosis, hallucinations, paranoia, delusions, homicidal ideation, aggression, hostility, agitation, anxiety, and panic, as well as suicidal thoughts and actions when attempting to quit smoking while taking bupropion. Instruct patients to discontinue bupropion hydrochloride extended-release tablets (XL) and contact a healthcare professional if they experience such symptoms [see **Warnings and Precautions** (5.2) and **Adverse Reactions** (6.2)].

**Severe Allergic Reactions**

Educate patients on the symptoms of hypersensitivity and to discontinue bupropion hydrochloride extended-release tablets (XL) if they have a severe allergic reaction.

**Seizure**

Instruct patients to discontinue and not restart bupropion hydrochloride extended-release tablets (XL) if they experience a seizure while on treatment. Advise patients that the excessive use or the abrupt discontinuation of bupropion hydrochloride extended-release tablets (XL) should be avoided in combination with ZYBAN<sup>®</sup> or any other medications that contain bupropion hydrochloride (such as WELLBUTRIN SR<sup>®</sup> (bupropion hydrochloride extended-release tablets (SR)), the sustained-release formulation, WELLBUTRIN XL<sup>®</sup> (bupropion hydrochloride extended-release tablets (XL)), the immediate-release formulation, and APLENZIN<sup>®</sup> (bupropion hydrochloride extended-release tablets (XL)) unless directed to do so by your healthcare provider.

**Angle-Closure Glaucoma**

Patients should be advised that taking bupropion hydrochloride extended-release tablets (XL) can cause mild pupillary dilation, which in susceptible individuals, can lead to an episode of angle-closure glaucoma. Pre-existing angle-closure glaucoma or a family history of angle-closure glaucoma, narrow-angle glaucoma, or prior laser peripheral iridotomy, without pupillary dilation, is not a risk factor for angle-closure glaucoma. Patients may wish to be examined to determine whether they are susceptible to angle closure, and have a prophylactic procedure performed, if they are susceptible [see **Warnings and Precautions** (5.7)].

**Bupropion-Containing Products**

Educate patients that bupropion hydrochloride extended-release tablets (XL) contains the same active ingredient (bupropion) found in ZYBAN<sup>®</sup>, which is used as an ad to smoking cessation treatment, and that bupropion hydrochloride extended-release tablets (XL) should not be used in combination with ZYBAN<sup>®</sup> or any other medications that contain bupropion hydrochloride (such as WELLBUTRIN SR<sup>®</sup> (bupropion hydrochloride extended-release tablets (SR)), the sustained-release formulation, WELLBUTRIN XL<sup>®</sup> (bupropion hydrochloride extended-release tablets (XL)), the immediate-release formulation, and APLENZIN<sup>®</sup> (bupropion hydrochloride extended-release tablets (XL)) unless directed to do so by your healthcare provider. In addition, there are a number of generic bupropion HCl products for the immediate, sustained, and extended-release formulations.

**Potential for Cognitive and Motor Impairment**
Advise patients that any CNS-active drug like bupropion hydrochloride extended-release tablets (XL) may impair their ability to perform tasks requiring judgment or motor and cognitive skills. Advise patients that until they are reasonably certain that bupropion hydrochloride extended-release tablets (XL) do not adversely affect their performance, they should refrain from driving an automobile or operating complex, hazardous machinery. Bupropion hydrochloride extended-release tablets (XL) treatment may lead to decreased alcohol tolerance.

**Concomitant Medications**

Counsel patients to notify their healthcare provider if they are taking or plan to take any prescription or over-the-counter drugs, because bupropion hydrochloride extended-release tablets (XL) and other drugs may affect each other's metabolism.

**Pregnancy**

Advise patients to notify their healthcare provider if they become pregnant or intend to become pregnant during therapy.

**Precautions for Nursing Mothers**

Communicate with the patient and pediatric healthcare provider regarding the infant's exposure to bupropion through human milk. Instruct patients to immediately contact the infant's healthcare provider if they note any side effect in the infant that concerns them or is persistent.

**Administration Information**

Instruct patients to swallow bupropion hydrochloride extended-release tablets (XL) whole so that the released dose is not altered. Instruct patients if they miss a dose, not to take an extra tablet to make up for the missed dose. Do not take more than the recommended dose. Advise patients that the risk of seizure is increased if bupropion hydrochloride extended-release tablets (XL) should be swallowed whole and not crushed, divided, or chewed. Bupropion hydrochloride extended-release tablets (XL) should be administered in the morning and may be taken with or without food.

<p> MEDICATION GUIDE </p> <p> <b>BUPROPION Hydrochloride</b> </p> <p> (bup'rope' on 'he' droe 'lor' XL) </p> <p> Extended-Release Tablets USP (XL) </p>
---

**IMPORTANT:** Be sure to read the three sections of this Medication Guide. The first section is about the risk of suicidal thoughts and behaviors, depression and suicidal thoughts or actions with medicines used to quit smoking; and the third section is entitled "What Other Important Information Should I Know About Bupropion Hydrochloride Extended-Release Tablets (XL)?"
**Antidepressant Medicines, Depression and Other Serious Mental Illnesses, and Suicidal Thoughts or Actions**
This section of the Medication Guide is only about the risk of suicidal thoughts and actions with antidepressant

**What is the most important information I should know about antidepressant medicines, depression and other serious mental illnesses, and suicidal thoughts or actions?**

- Antidepressant medicines may increase the risk of suicidal thoughts or actions in some children, teenagers, or young adults within the first few months of treatment.**
- Depression or other serious mental illnesses are the most important causes of suicidal thoughts and actions. Some people may have a particularly high risk of having suicidal thoughts or actions.** These include people who have (or have a family history of) bipolar illness (also called manic-depressive illness), or who have ever had suicidal thoughts or actions.
- How can I watch for and try to prevent suicidal thoughts and actions in myself or a family member?**
  - Pay close attention to any changes, especially sudden changes, in mood, behaviors, thoughts, or feelings. This is very important when an antidepressant medicine is started or when the dose is changed.</
